# Hybrid Hosting

What is hybrid hosting?

Many hosting providers sell businesses on a panacea – a public cloud that can solve all problems. Unfortunately, as of today, that solution does not exist, except for maybe the most simple implementations. Don't fall into the trap! With full knowledge, a business can implement what does work well in the public cloud and allocate the rest to a different type of hosting that is a better fit. This is what you call a hybrid hosting environment. You choose the right hosting tool to solve each problem. Many companies with complex workloads find this to be the perfect way to reap the many benefits of cloud without compromising their critical applications and data.

Key Benefits

- ✓ Custom solution – best of all worlds
- ✓ Increased efficiency which leads to cost savings
- ✓ Eliminate most of the disadvantages of any one hosting type
- ✓ Various additional benefits that come with each hosting solution you choose – high performance, security, compliance, etc.
- ✓ Your focus can remain on the growth of your business, not IT infrastructure

How will the different types of hosting connect to each other?

With colocation and dedicated leased server hosting, connecting them together on a network is fairly straightforward. However, when you throw public cloud into the mix, you will need to carefully choose a connectivity solution.

Option 1 ＞ Connect your servers via a VPN over the Internet.

Option 2 ＞ Order a **direct** connection between the hosting environments. This is the most costly option, but also the most reliable and secure.
